

Coffee Brief

Date: June 20, 2022

Preparedness Levels & Alaska Fire Activity

Alaska	3
National	2

Light Initial Attack Activity New Fires and Acres: 10 Fires 346 Acres
--

There are currently 11 staffed fires with 571 personnel. Yesterday's large fire growth was 19,857 acres.

Resources

Aviation within Alaska	
Jumpship	5
Air Tactical	7
Air Tankers	3
Scoopers	
SEATS	18
Utility	11
T1 Helicopter	
T2 Helicopter	13
T3 Helicopter	6

Crews Committed within Alaska		
Type 1	1	AK
Type 2	6	AK
Type 21A	4	AK
Module	1	AK
Type 1	10	L-48
Type 2		L-48
Type 21A		L-48
Module		L-48
Total Crews	22	

AVIATION: 20 SMJ's available ~ 45 SMJ's committed.

CREWS: Nothing in addition to table.

MISCELLANEOUS:

AK IMT2 Black Team is currently in command of the Lime Complex.

AK IMT2 Green Team is currently in command of the East Fork incident.

Weather Summary

Thunderstorms will be a factor for Alaska once again today, with today's action mostly north of the Alaska Range and along the lower half of the Yukon River. Temperatures for the Interior will be roughly near normal, with widespread readings in the 60s and 70s today. Other areas will be cooler, with 50s and 60s. The overall wind pattern over mainland Alaska is not very strong today, with the notable exception being the south winds of 15 to 25 mph through Alaska Range passes this morning and redeveloping again overnight and into Sunday morning. Thunderstorms also have the potential to generate brief gusty local winds.

The cool and wet regime that moved into Southwest Alaska over the last couple of days is now spreading eastward to South Central Alaska and the Southeast Panhandle over the next couple of days. Thunder is expected in these areas.

In the longer term, a high pressure system is set to park itself near Kodiak Island during the second half of the work week. This pattern would bring several days of dry and warm weather to South Central Alaska while the Interior will have seasonable temperatures and showers and thunderstorms in the afternoons. The wind regime will not be particularly strong with this pattern, but thunderstorms can still produce gusty winds.

Fuels/Fire Potential

Showers and wet thunderstorms have lowered indices across much of the central and eastern Interior over the last couple of days. However, the spotty nature of this precipitation shows that some areas have remained dry. Indices have also come down from Southwest Alaska through South Central and into the Southeast Panhandle. The area of highest values is now in northwest Alaska, also sub-surface warming and drying is a couple weeks delayed compared to conditions in the Interior.

Fuels Status [Alaska Fire and Fuels Map](#)

A Fuels and Fire Behavior Advisory has been issued for Alaska.

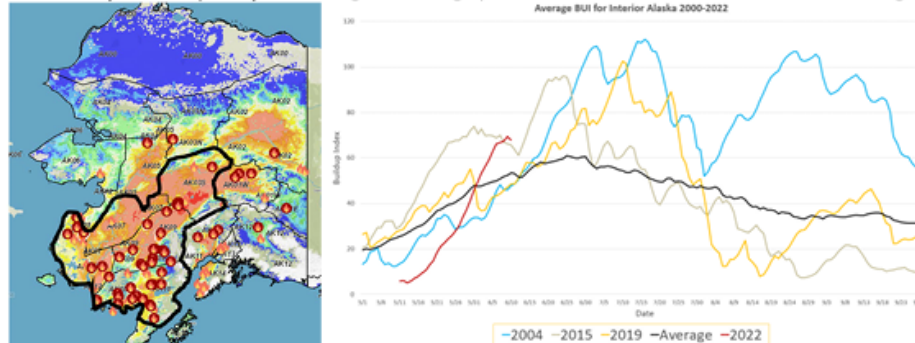

Fuels and Fire Behavior Advisory Southwest and Central Interior Alaska

Valid: June 12 – June 25, 2022

Subject: Exceptional landscape flammability and widespread ongoing large fire growth.

Discussion: The Buildup Index (BUI) is the best indicator of seasonal severity and overall flammability of fuels in Alaska. It represents deeper drying in the duff layers and greater fuel availability. Large fire growth occurs from mid-June to mid-July surrounding the summer solstice when long days and rapid drying can produce elevated BUI levels. Southwest Alaska normally experiences shorter periods of high flammability as they are prone to intermittent rain due to marine influences. Beginning in the middle of May, southwest Alaska has experienced continued hot, dry, and windy conditions, drying out fuels, retarding green-up and producing significant large fire growth. Many fires in southwest Alaska have experienced exceptionally large fire growth over the last week, which is unusual for the area.

Difference from normal conditions: The attached graph shows the current 2022 BUI trend for the Interior of Alaska compared to other busy fire seasons. 2022 has been above average BUI since May 31, and higher than 2015 levels since June 6. Southwest Alaska has already experienced abnormally large fire growth for this time of year. Multiple days of wetting rain adding up to more than one inch will be needed for lasting relief.

Concerns to Firefighters and the Public:

- Spruce stands are extremely flammable, will ignite readily, exhibit rates of spread more than one mile per hour, torch, and spot prolifically up to ¼ mile or more, and exhibit intense crown fire behavior.
- Temperatures above 80 degrees and RH below 30% are important thresholds for rapid spread and crown fire behavior.
- Green fuels are stressed and encouraging spread into riparian areas and less flammable hardwood forests.

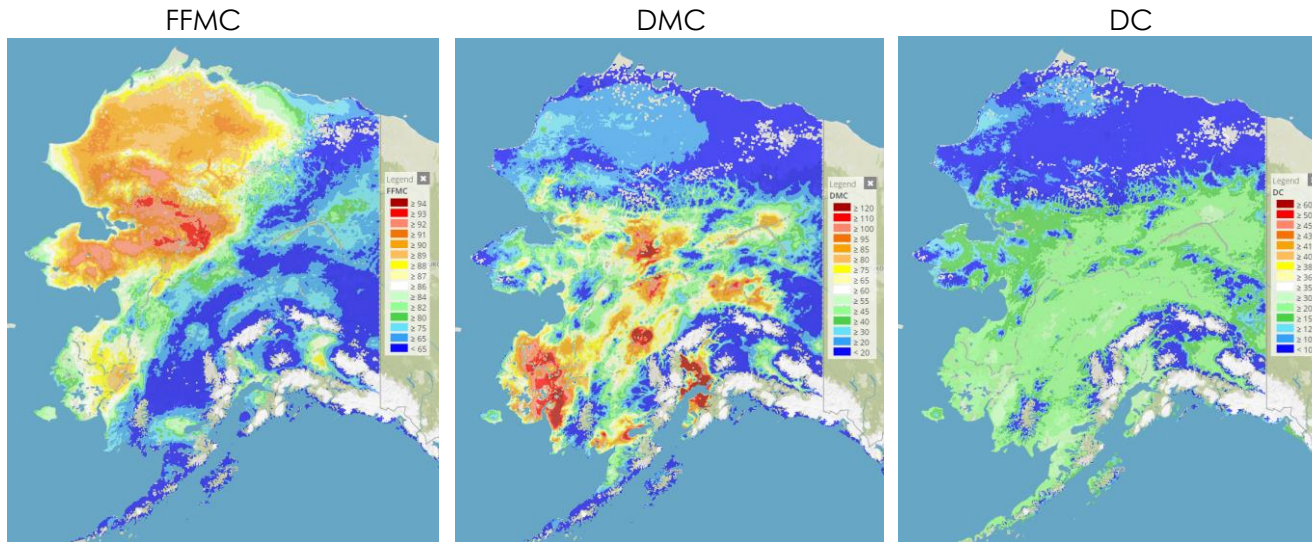

Mitigation Measures:

- Ensure that you can recognize hazardous fuel types including tundra that is exceptionally dry.
- Understand the triggers and thresholds for problem fire behavior.
- Monitor forecasts and indices to anticipate areas of increased flammability and extreme fire behavior.
- Maintain clear communications when working around active fires.

Area of Concern: Southwest Alaska, and the central Interior. Conditions over the next few weeks may spread to include a wider portion of Alaska.
